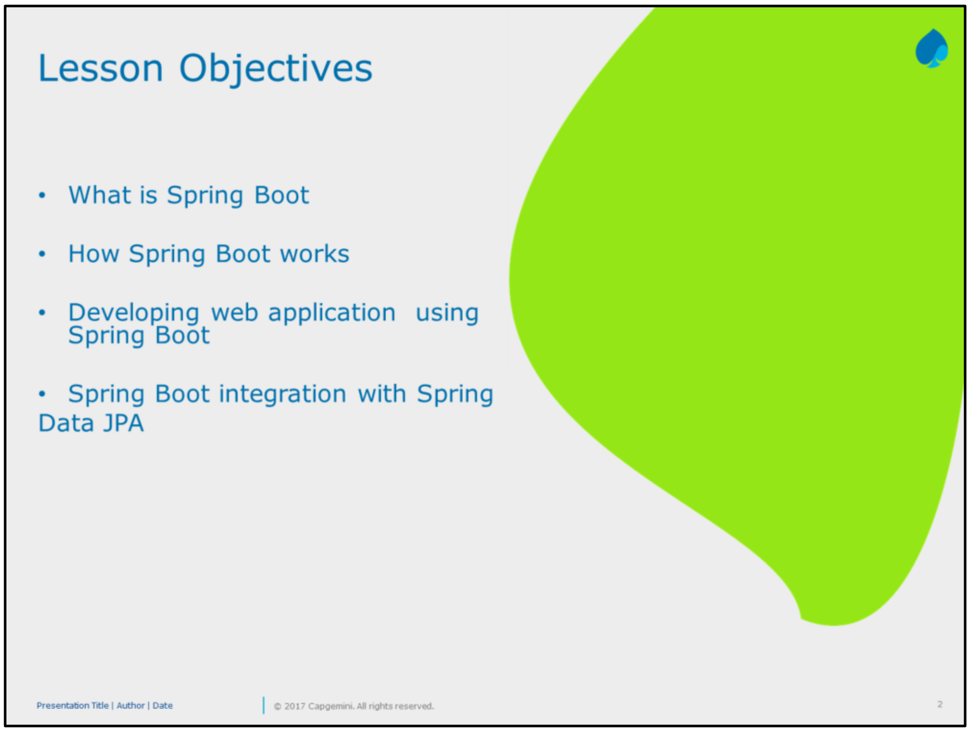
Spring Boot

Basic Spring 5.0

Instructor Notes:

Add instructor notes here.



Lesson Objectives

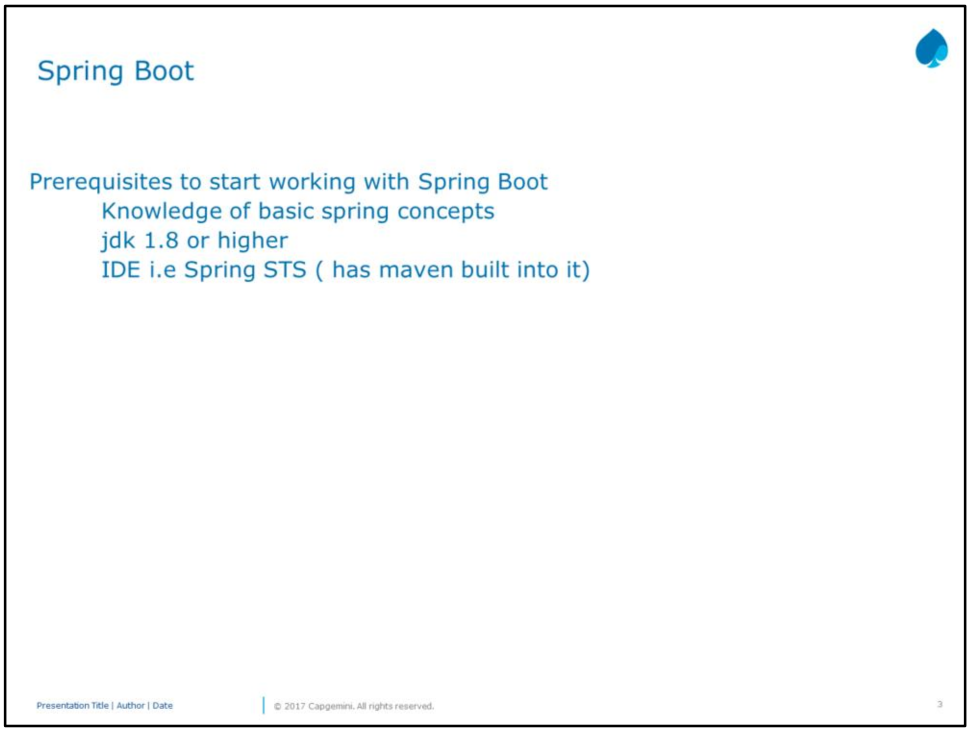
- What is Spring Boot
- How Spring Boot works
- Developing web application using Spring Boot
- Spring Boot integration with Spring Data JPA

Presentation Title | Author | Date | © 2017 Capgemini. All rights reserved. 2

Following contents would be covered:

- What is Spring Boot
- How Spring Boot works
- Developing web application using Spring Boot
- Spring Boot integration with Spring Data JPA

Instructor Notes:



Spring Boot

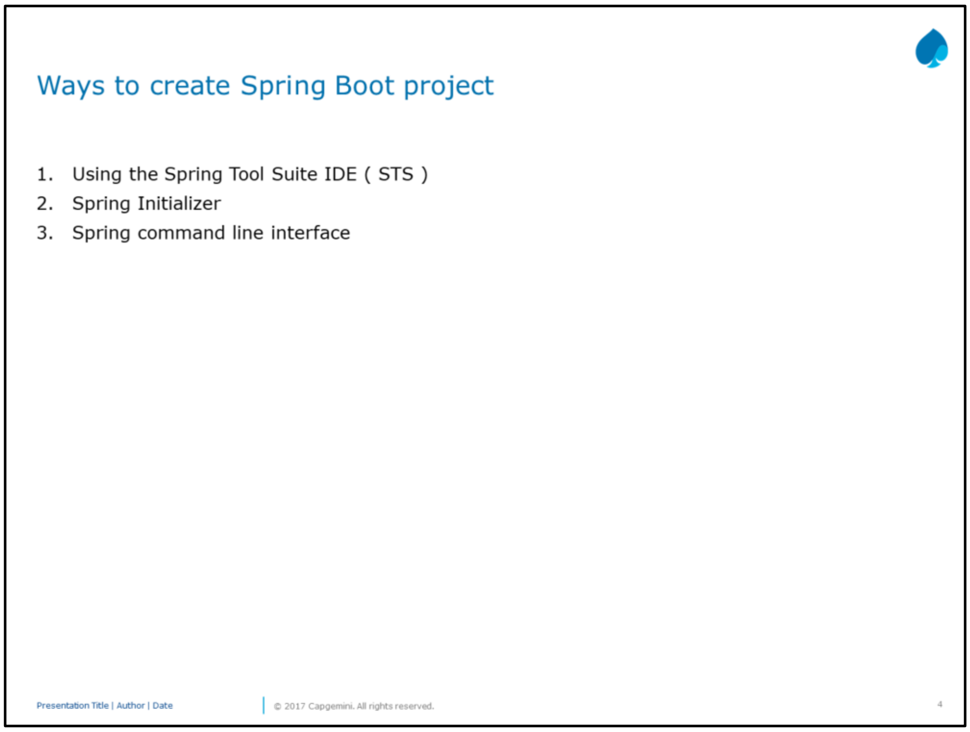
Prerequisites to start working with Spring Boot
- Knowledge of basic spring concepts
- jdk 1.8 or higher
- IDE i.e Spring STS (has maven built into it)

Presentation Title | Author | Date

3

Spring STS can be downloaded from spring.io/tools

Instructor Notes:

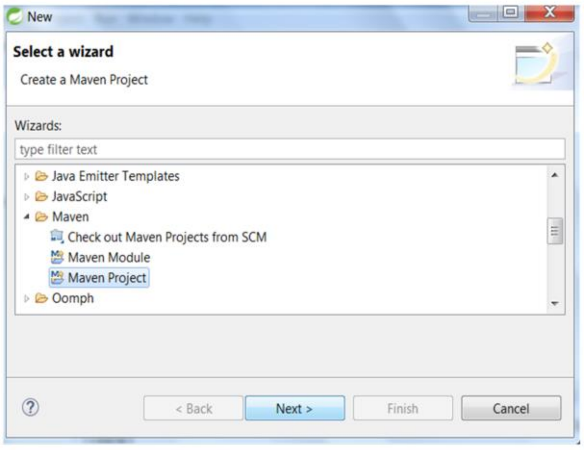


Ways to create Spring Boot project

1. Using the Spring Tool Suite IDE (STS)
2. Spring Initializer
3. Spring command line interface

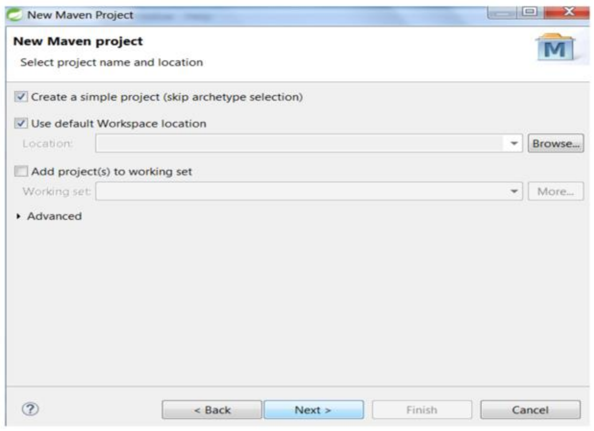
Instructor Notes:

Creating a spring boot application using STS IDE
Click on menu , File →New –Other - Maven -Maven Project- Click on Next



Instructor Notes:

Creating a spring boot application using STS IDE
Select the checkbox, "Create a simple project" and Click On Next-



New Maven Project

New Maven project

Select project name and location

☑ Create a simple project (skip archetype selection)

☑ Use default Workspace location

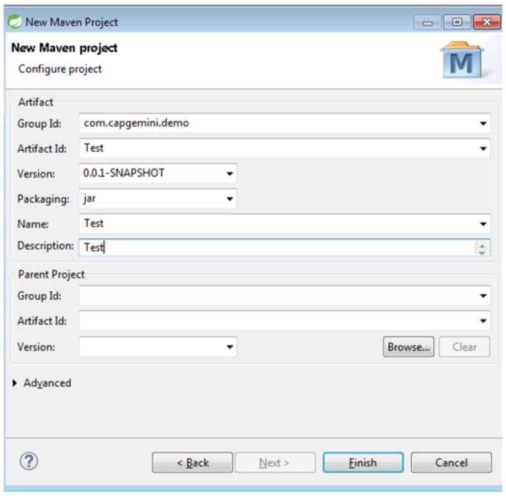
Location:

☐ Add project(s) to working set

Working set:

Instructor Notes:

Specify the group id, artifact Id, name and description
Click On Finish. Observe the folder structure of the newly created project



New Maven Project

New Maven project
Configure project

Artifact

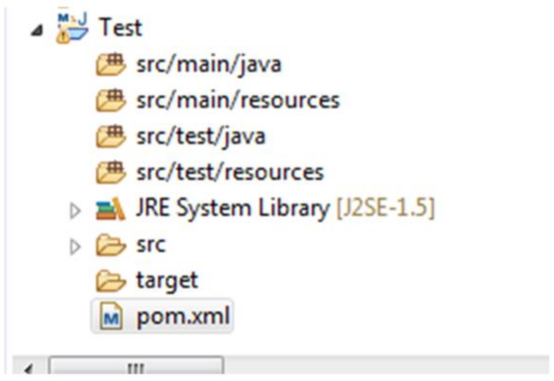
Group Id:	com.capgemini.demo
Artifact Id:	Test
Version:	0.0.1-SNAPSHOT
Packaging:	jar
Name:	Test
Description:	Test

Parent Project

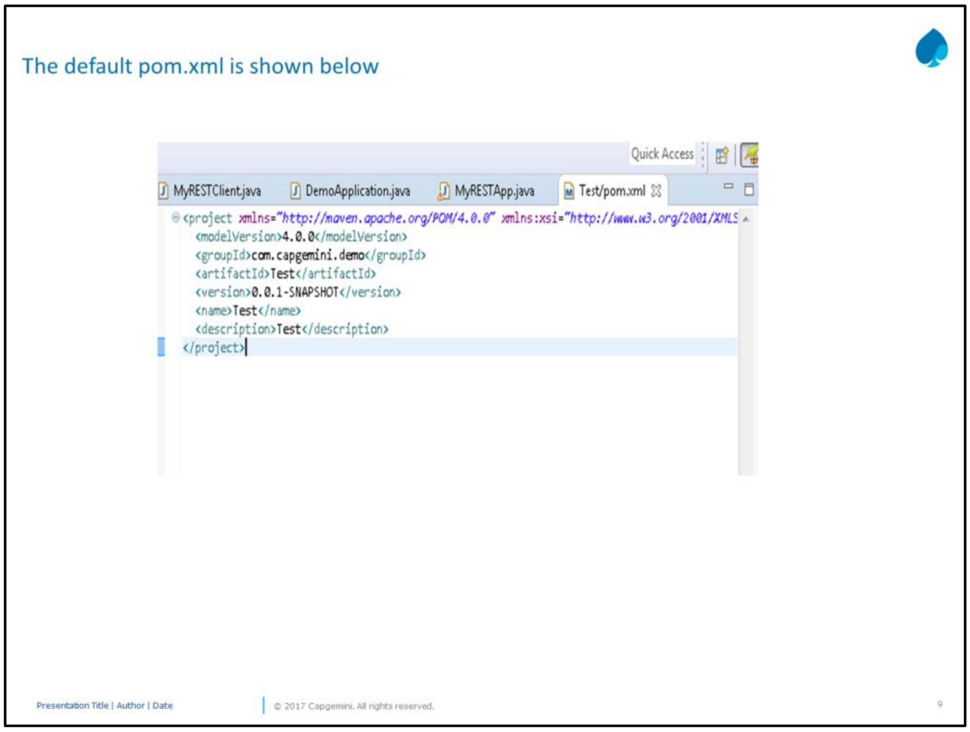
Group Id:	
Artifact Id:	
Version:	

Instructor Notes:

Double click on the generated pom.xml file



Instructor Notes:

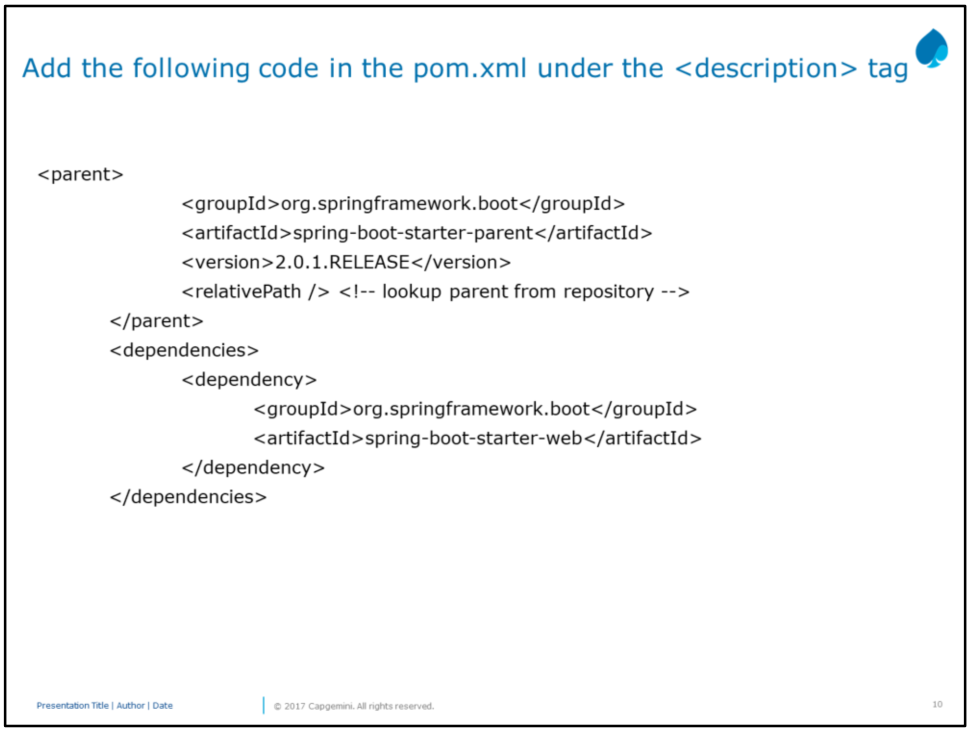


The default pom.xml is shown below

```
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLS
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.capgemini.demo</groupId>
  <artifactId>Test</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <name>Test</name>
  <description>Test</description>
</project>
```

Presentation Title | Author | Date © 2017 Capgemini. All rights reserved. 9

Instructor Notes:



Add the following code in the pom.xml under the <description> tag

```
<parent>
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-starter-parent</artifactId>
            <version>2.0.1.RELEASE</version>
            <relativePath /> <!-- lookup parent from repository -->
      </parent>
      <dependencies>
            <dependency>
                  <groupId>org.springframework.boot</groupId>
                  <artifactId>spring-boot-starter-web</artifactId>
            </dependency>
      </dependencies>
```

Presentation Title | Author | Date | © 2017 Capgemini. All rights reserved. 10

```
<parent>

                <groupId>org.springframework.boot</groupId>
                <artifactId>spring-boot-starter-parent</artifactId>
                <version>2.0.1.RELEASE</version>
                <relativePath /> <!-- lookup parent from repository -->
                </parent>
```

Above entry will bring in all the dependency management features of Spring boot .

There is no need to declare all the dependencies one by one in pom.xml

```
<dependencies>
                <dependency>

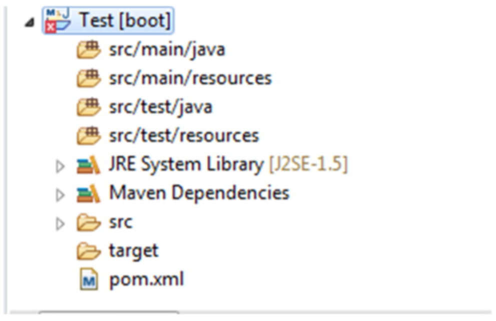
                <groupId>org.springframework.boot</groupId>

                <artifactId>spring-boot-starter-web</artifactId>
                </dependency>
                </dependencies>
```

Above will integrate Spring MVC and autoconfigure the project for us.
When u add the Spring boot starter web dependency in pom.xml, this brings in the Spring MVC sub framework dependency into the application.

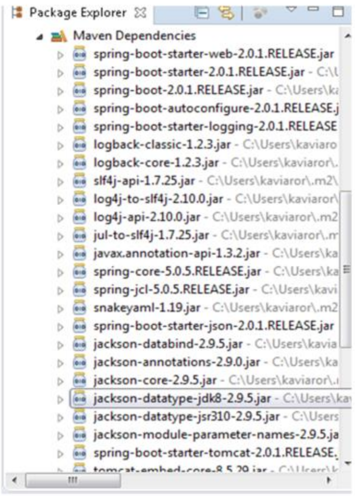
Instructor Notes:

Observe that "Maven Dependencies" has been included into the project



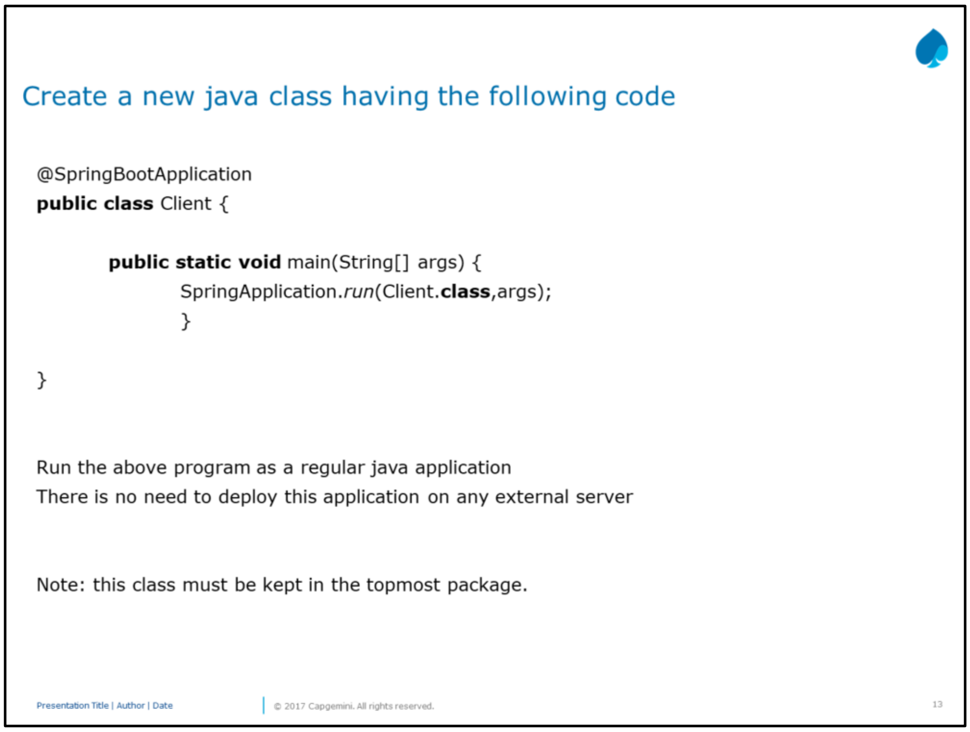
Instructor Notes:

Without Spring Boot, these jar files are among those that you would have had to copy physically into the project



```
Package Explorer
  Maven Dependencies
    spring-boot-starter-web-2.0.1.RELEASE.jar
    spring-boot-starter-2.0.1.RELEASE.jar - C:\U
    spring-boot-2.0.1.RELEASE.jar - C:\Users\ka
    spring-boot-autoconfigure-2.0.1.RELEASE.j
    spring-boot-starter-logging-2.0.1.RELEASE
    logback-classic-1.2.3.jar - C:\Users\kaviaro
    logback-core-1.2.3.jar - C:\Users\kaviaror\.
    slf4j-api-1.7.25.jar - C:\Users\kaviaror\.m2\
    log4j-to-slf4j-2.10.0.jar - C:\Users\kaviaror\
    log4j-api-2.10.0.jar - C:\Users\kaviaror\.m2
    jul-to-slf4j-1.7.25.jar - C:\Users\kaviaror\.m
    javax.annotation-api-1.3.2.jar - C:\Users\ka
    spring-core-5.0.5.RELEASE.jar - C:\Users\ka
    spring-jcl-5.0.5.RELEASE.jar - C:\Users\kavi
    snakeyaml-1.19.jar - C:\Users\kaviaror\.m2
    spring-boot-starter-json-2.0.1.RELEASE.jar
    jackson-databind-2.9.5.jar - C:\Users\kavia
    jackson-annotations-2.9.0.jar - C:\Users\ka
    jackson-core-2.9.5.jar - C:\Users\kaviaror\.
    jackson-datatype-jdk8-2.9.5.jar - C:\Users\ka
    jackson-datatype-jsr310-2.9.5.jar - C:\Users
    jackson-module-parameter-names-2.9.5.ja
    spring-boot-starter-tomcat-2.0.1.RELEASE.
    tomcat-embed-core-8.5.29.jar - C:\Users\k
```

Instructor Notes:



Create a new java class having the following code

```
@SpringBootApplication
public class Client {

        public static void main(String[] args) {
                SpringApplication.run(Client.class,args);
                }

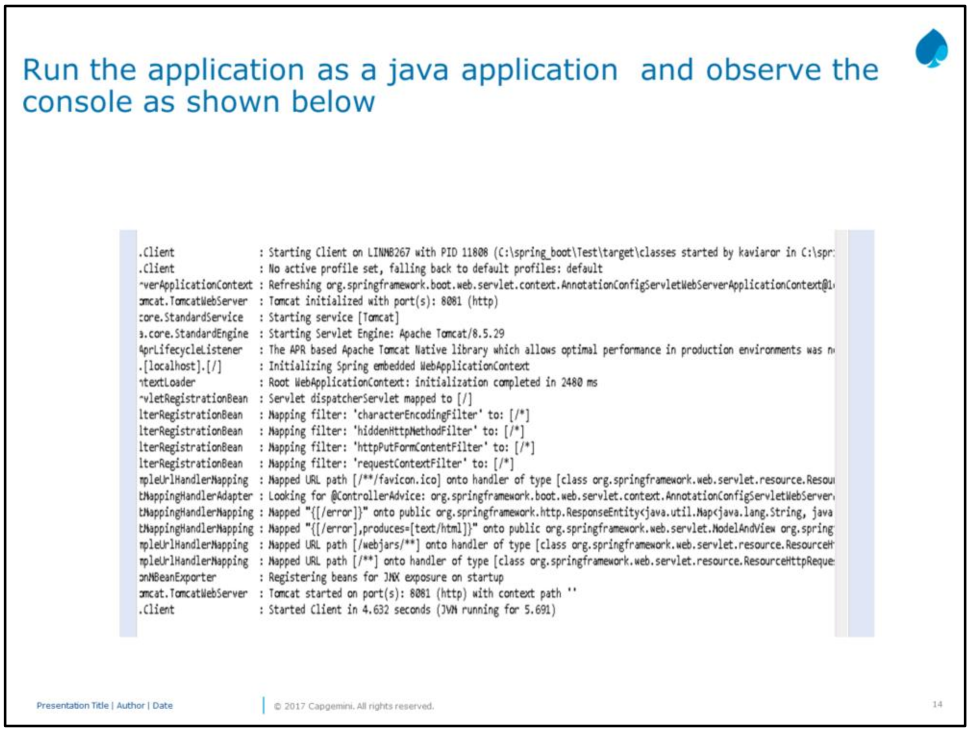
}
```

Run the above program as a regular java application
There is no need to deploy this application on any external server

Note: this class must be kept in the topmost package.

SpringApplication.run(): Starts Spring, creates Spring context , applies annotations and sets up embedded container

Instructor Notes:



Run the application as a java application and observe the console as shown below

```
.Client                  : Starting Client on LINMB267 with PID 11808 (C:\spring_boot\Test\target\classes started by kaviaror in C:\spr

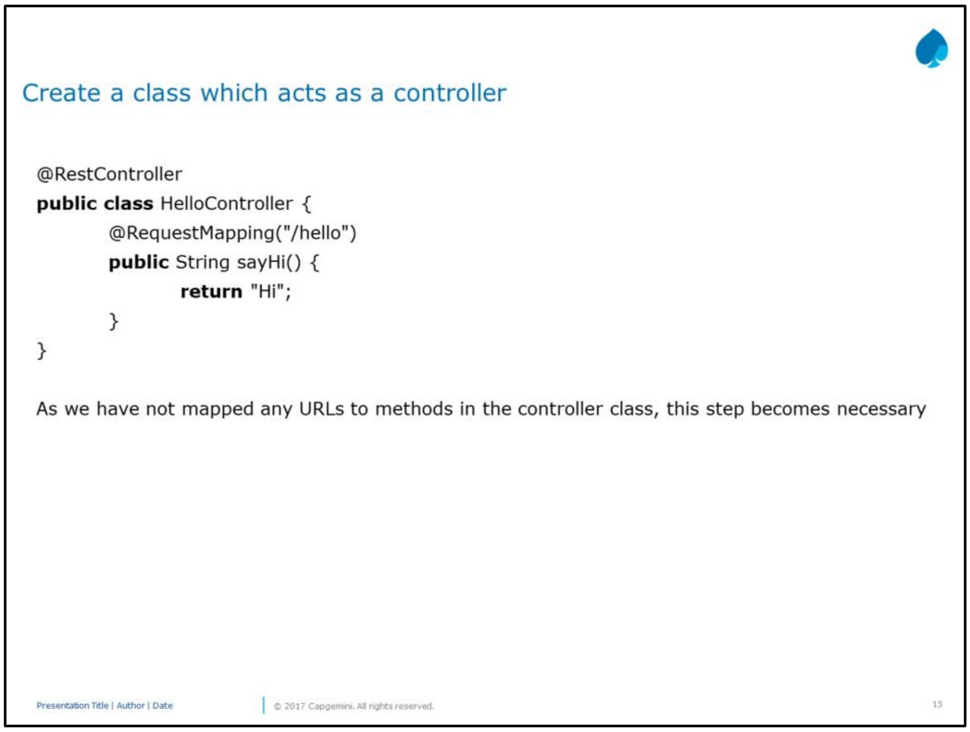
14

Instructor Notes:

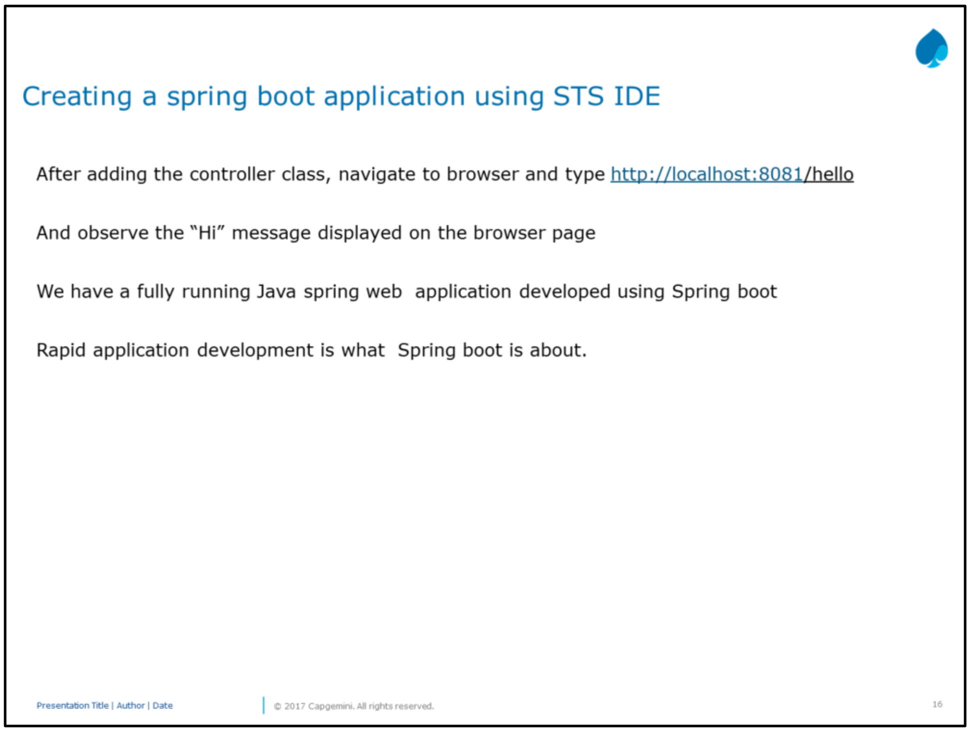


Create a class which acts as a controller

```
@RestController
public class HelloController {
        @RequestMapping("/hello")
        public String sayHi() {
                return "Hi";
        }
}
```

As we have not mapped any URLs to methods in the controller class, this step becomes necessary

Instructor Notes:



Creating a spring boot application using STS IDE

After adding the controller class, navigate to browser and type http://localhost:8081/hello

And observe the "Hi" message displayed on the browser page

We have a fully running Java spring web application developed using Spring boot

Rapid application development is what Spring boot is about.

Presentation Title | Author | Date

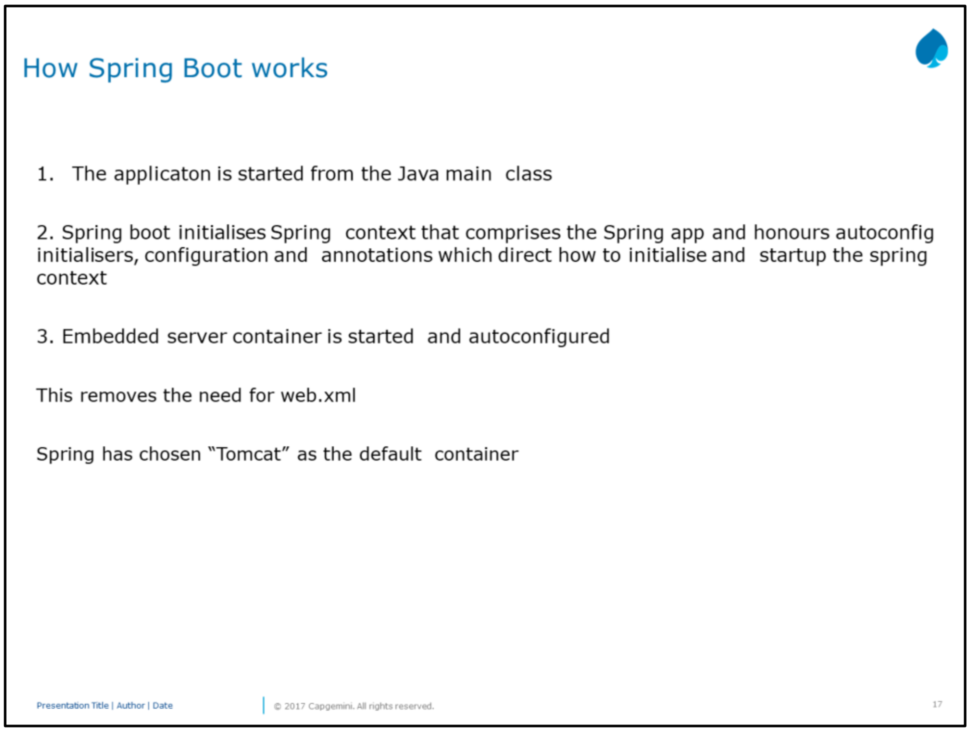
16

Use the following to change the default port 8080 on which Tomcat listens

application.properties file
src ->main ->resources .. keep file here
server.port=8081

Instructor Notes:



How Spring Boot works

1. The applicaton is started from the Java main class

2. Spring boot initialises Spring context that comprises the Spring app and honours autoconfig initialisers, configuration and annotations which direct how to initialise and startup the spring context

3. Embedded server container is started and autoconfigured

This removes the need for web.xml

Spring has chosen “Tomcat” as the default container

Presentation Title | Author | Date

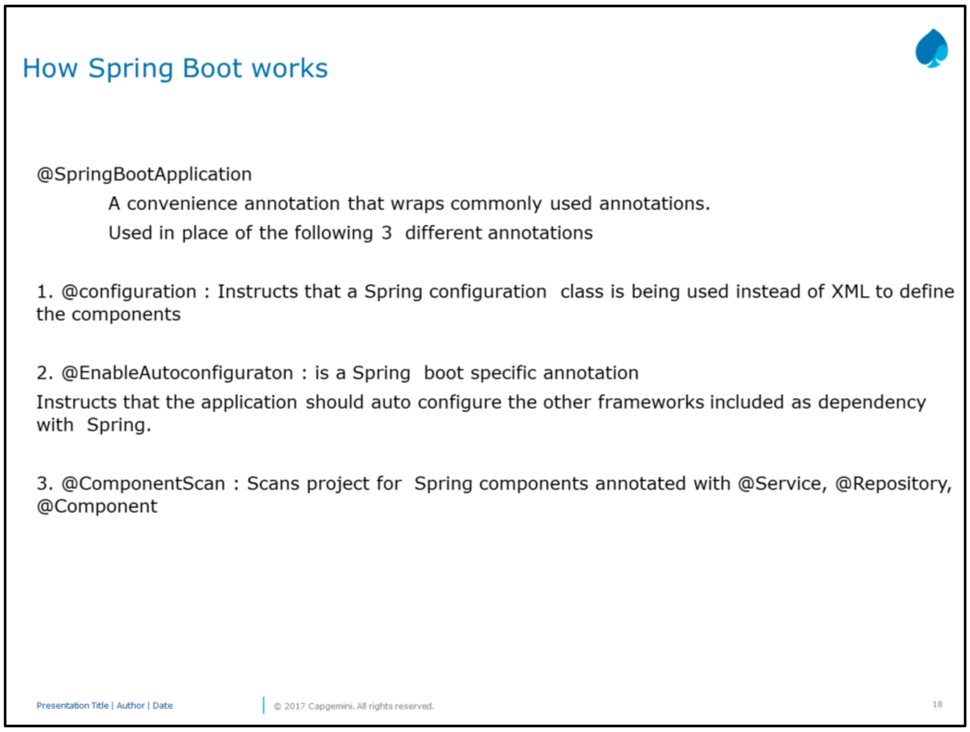
17

Instructor Notes:



How Spring Boot works

@SpringBootApplication

A convenience annotation that wraps commonly used annotations.

Used in place of the following 3 different annotations

1. @configuration : Instructs that a Spring configuration class is being used instead of XML to define the components

2. @EnableAutoconfiguraton : is a Spring boot specific annotation
Instructs that the application should auto configure the other frameworks included as dependency with Spring.

3. @ComponentScan : Scans project for Spring components annotated with @Service, @Repository, @Component

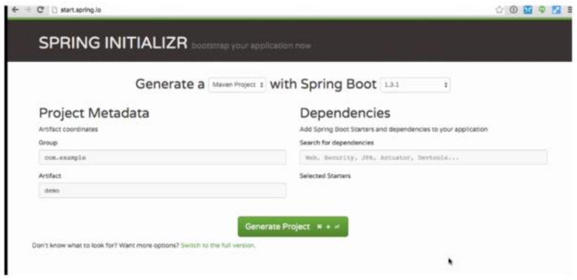
Presentation Title | Author | Date | © 2017 Capgemini. All rights reserved. 18

@EnableAutoconfiguration : This annotation told Spring boot to automatically set up so that we can use Spring controllers wihout doing any other integration work with MVC framework

Instructor Notes:

Spring Initializer

Navigate to the following URL
start.spring.io



start.spring.io

SPRING INITIALIZR bootstrap your application now

Generate a Maven Project with Spring Boot 1.3.1

Project Metadata
Artifact coordinates
Group: com.example
Artifact: demo

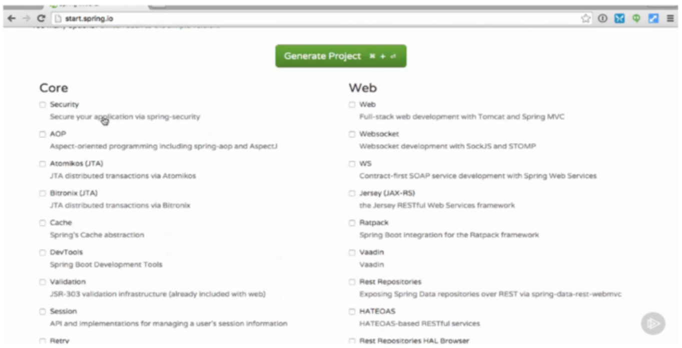
Dependencies
Add Spring Boot Starters and dependencies to your application
Search for dependencies: Web, Security, JPA, Actuator, Devtools...
Selected Starters

Generate Project

Don't know what to look for? Want more options? Switch to the full version.

Click on "switch to full version" link

Instructor Notes:



start.spring.io

Generate Project ⌘ + ⏎

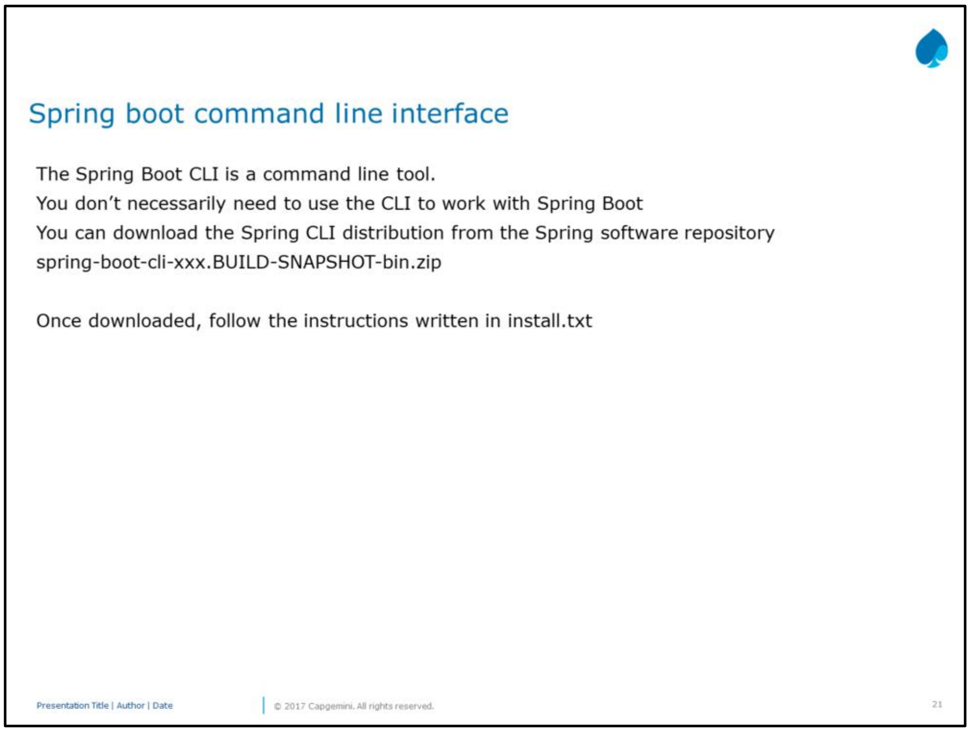
Core
- ☐ Security
  Secure your application via spring-security
- ☐ AOP
  Aspect-oriented programming including spring-aop and AspectJ
- ☐ Atomikos (JTA)
  JTA distributed transactions via Atomikos
- ☐ Bitronix (JTA)
  JTA distributed transactions via Bitronix
- ☐ Cache
  Spring's Cache abstraction
- ☐ DevTools
  Spring Boot Development Tools
- ☐ Validation
  JSR-303 validation infrastructure (already included with web)
- ☐ Session
  API and implementations for managing a user's session information
- ☐ Retry

Web
- ☐ Web
  Full-stack web development with Tomcat and Spring MVC
- ☐ Websocket
  Websocket development with SockJS and STOMP
- ☐ WS
  Contract-first SOAP service development with Spring Web Services
- ☐ Jersey (JAX-RS)
  the Jersey RESTful Web Services framework
- ☐ Ratpack
  Spring Boot integration for the Ratpack framework
- ☐ Vaadin
  Vaadin
- ☐ Rest Repositories
  Exposing Spring Data repositories over REST via spring-data-rest-webmvc
- ☐ HATEOAS
  HATEOAS-based RESTful services
- ☐ Rest Repositories HAL Browser

Select appropriate checkboxes which represent the different dependencies you want to include in the project and then click on "Generate Project"

Observe the zip file created for you.
This contains the folder structure of the project

Instructor Notes:



Spring boot command line interface

The Spring Boot CLI is a command line tool.
You don’t necessarily need to use the CLI to work with Spring Boot
You can download the Spring CLI distribution from the Spring software repository
spring-boot-cli-xxx.BUILD-SNAPSHOT-bin.zip

Once downloaded, follow the instructions written in install.txt

Presentation Title | Author | Date

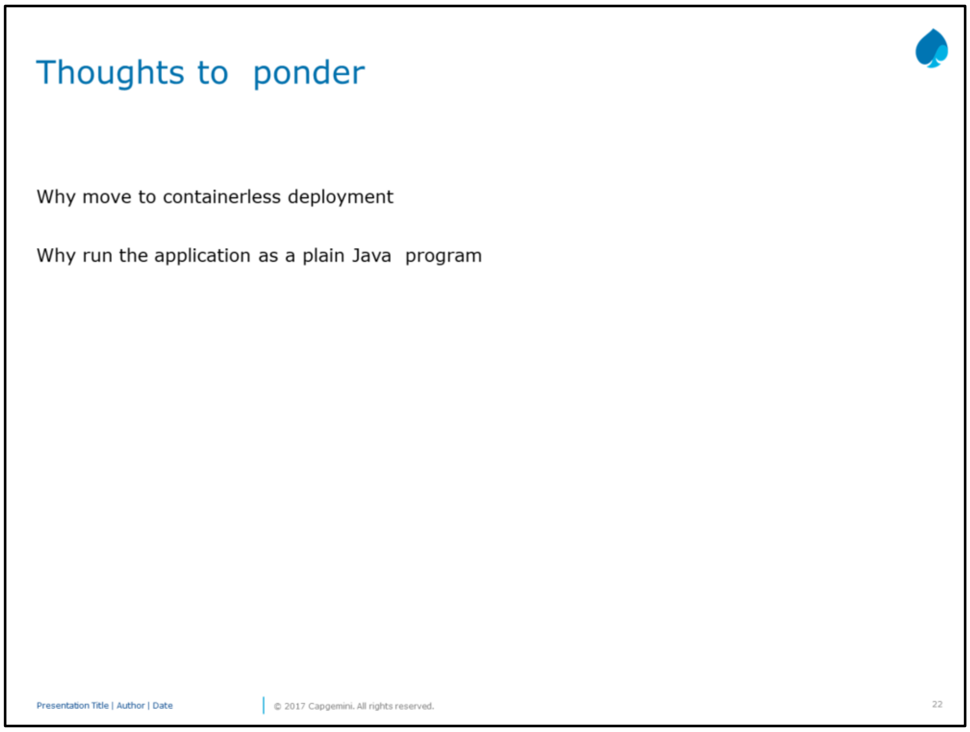
21

Instructor Notes:

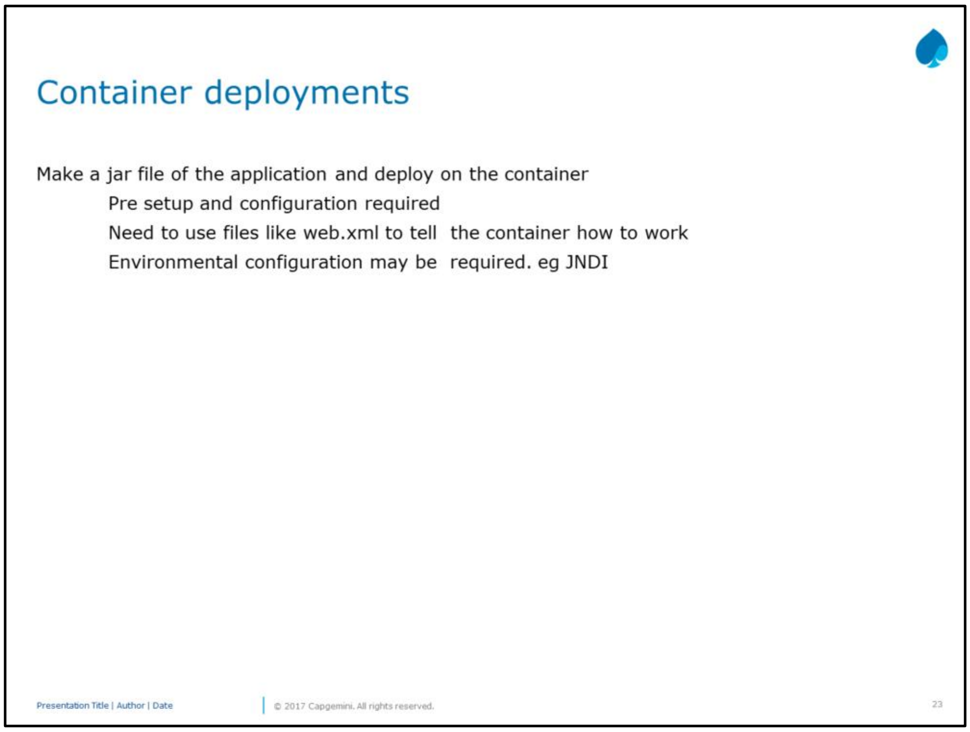


Thoughts to ponder

Why move to containerless deployment

Why run the application as a plain Java program

Instructor Notes:

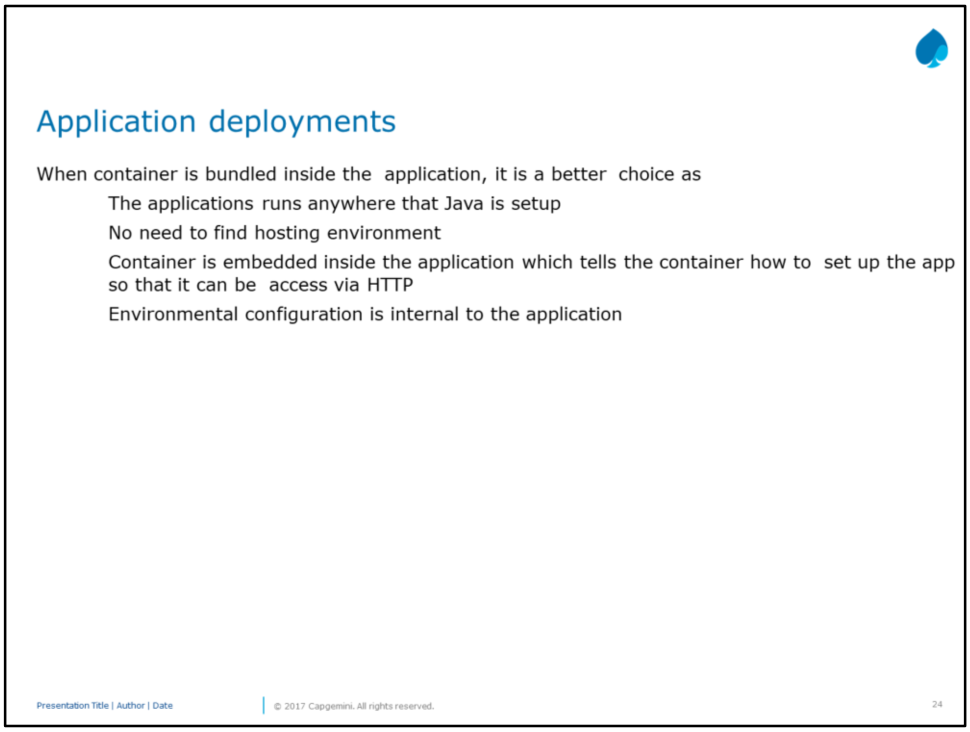


Container deployments

Make a jar file of the application and deploy on the container
- Pre setup and configuration required
- Need to use files like web.xml to tell the container how to work
- Environmental configuration may be required. eg JNDI

Presentation Title | Author | Date © 2017 Capgemini. All rights reserved. 23

Instructor Notes:



Application deployments

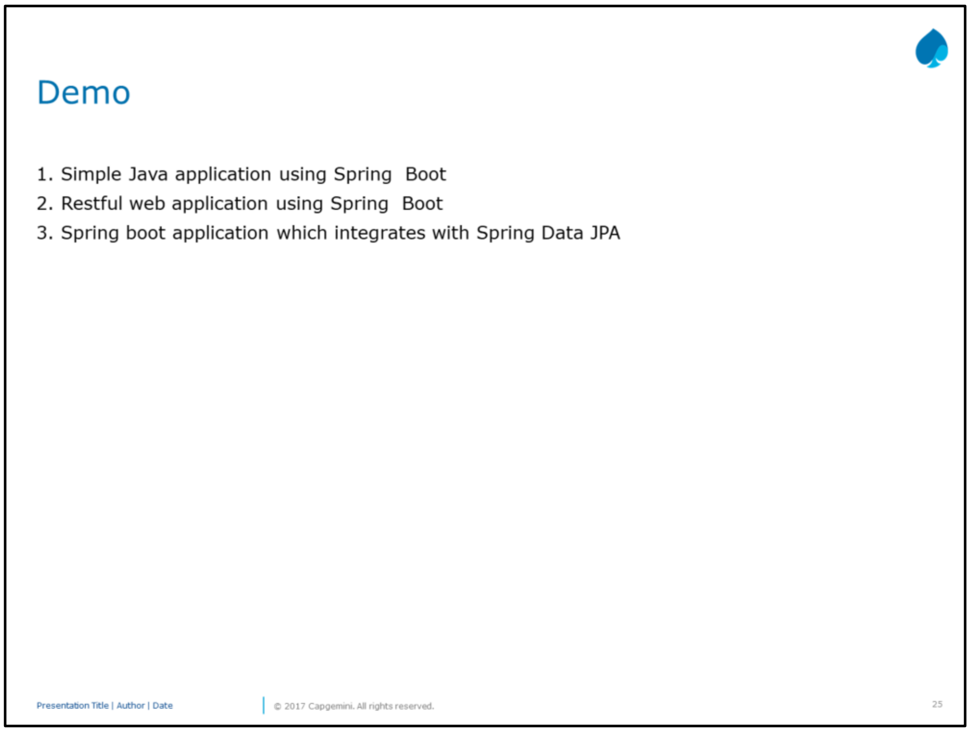
When container is bundled inside the application, it is a better choice as

- The applications runs anywhere that Java is setup
- No need to find hosting environment
- Container is embedded inside the application which tells the container how to set up the app so that it can be access via HTTP
- Environmental configuration is internal to the application

Presentation Title | Author | Date

24

Instructor Notes:

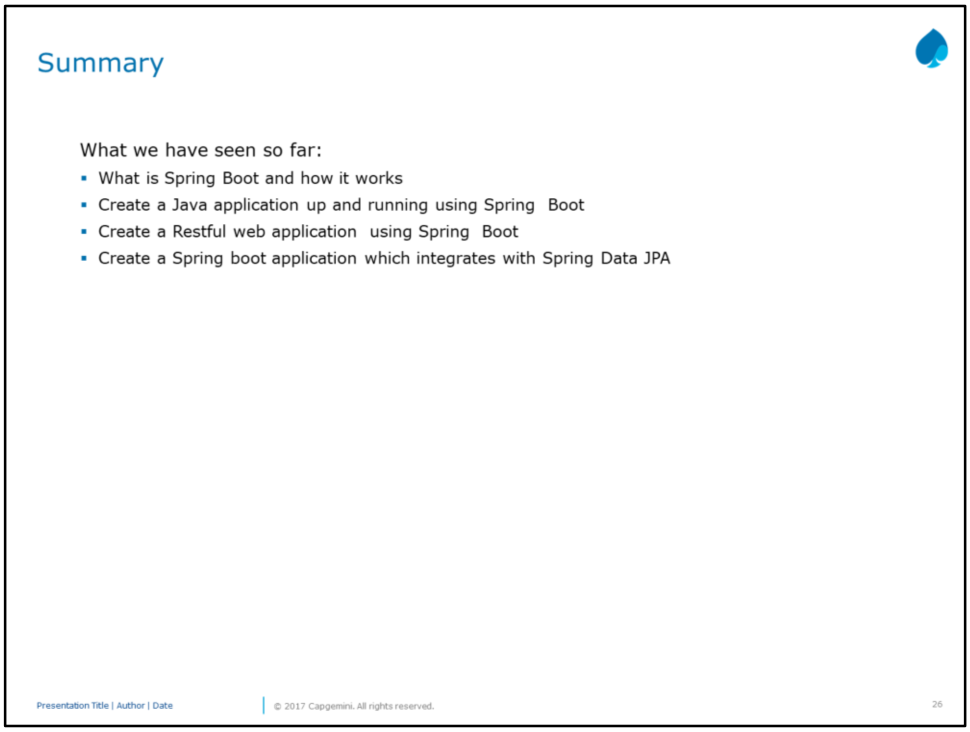


Demo

1. Simple Java application using Spring Boot
2. Restful web application using Spring Boot
3. Spring boot application which integrates with Spring Data JPA

Instructor Notes:

Trainer can summarize the points



Summary

What we have seen so far:

- What is Spring Boot and how it works
- Create a Java application up and running using Spring Boot
- Create a Restful web application using Spring Boot
- Create a Spring boot application which integrates with Spring Data JPA

Presentation Title | Author | Date
